Operations, with a shared view.

DASHBOARDS / BUSINESS RULES · Supabase · PostgreSQL · Web dashboards

Illustrative demo · fictional data. These visuals explain representative workflows; they are not screenshots of client systems or measured outcomes.

The problem

Daily planning depends on consistent definitions of clients, campaign capacity, assignments, and performance.

My contribution

I maintain and improve role-specific dashboards, translate operating rules into frontend and SQL changes, and check reported results against source records.

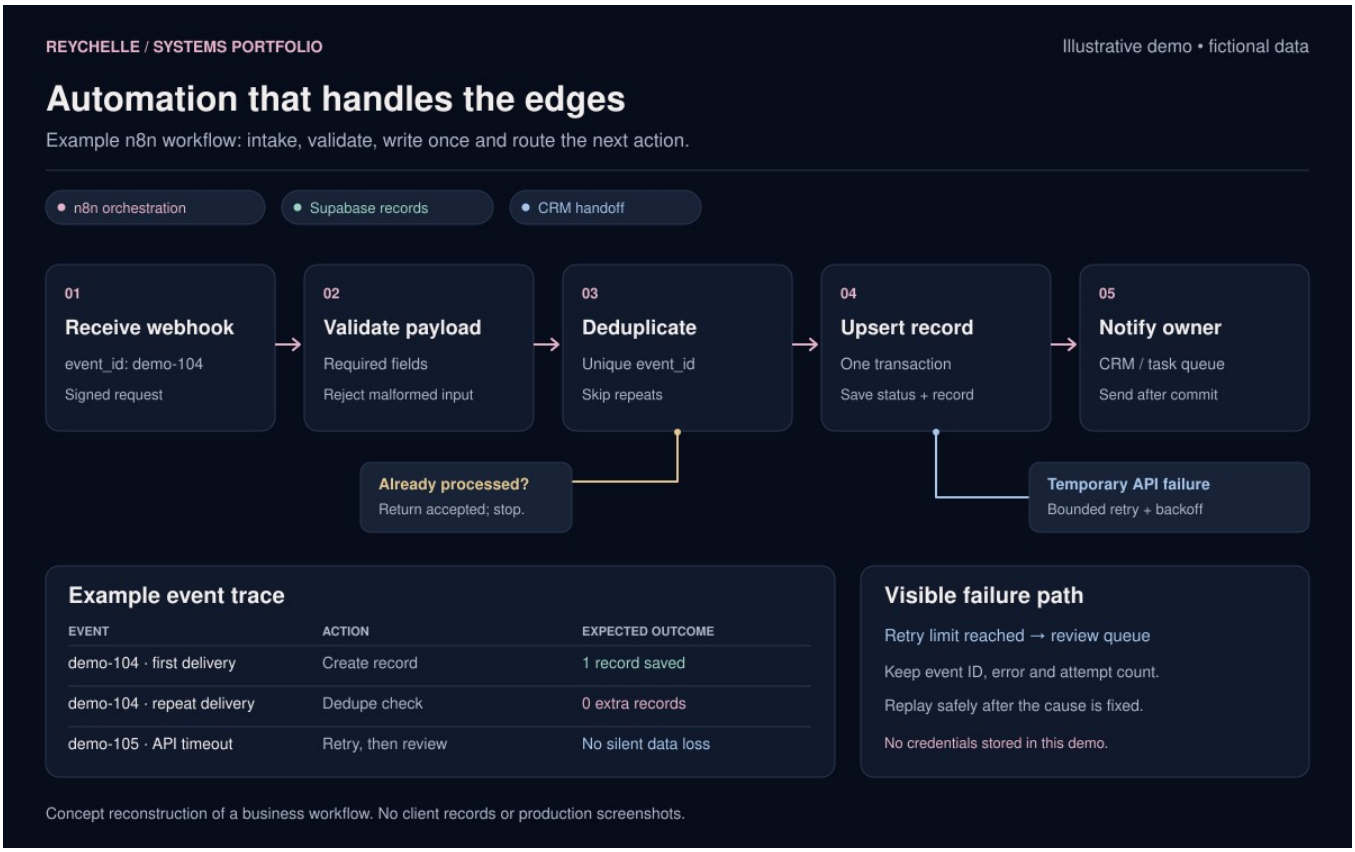

How I check the work

Trace a displayed total back to its query and source records. Check filters, role access, missing assignments, and stale data.

reychelle.com | reychellebarrot@gmail.com

A handoff you can trace.

AUTOMATION / CRM INTEGRATIONS · n8n · GoHighLevel · APIs & webhooks

Illustrative demo · fictional data. These visuals explain representative workflows; they are not screenshots of client systems or measured outcomes.

The problem

Lead intake and CRM updates cross multiple systems. A missed webhook or stuck queue can leave the next person without the information they need.

My contribution

I work on lead-intake, communication, and CRM synchronization workflows, investigating queue states, webhook gaps, and failed updates.

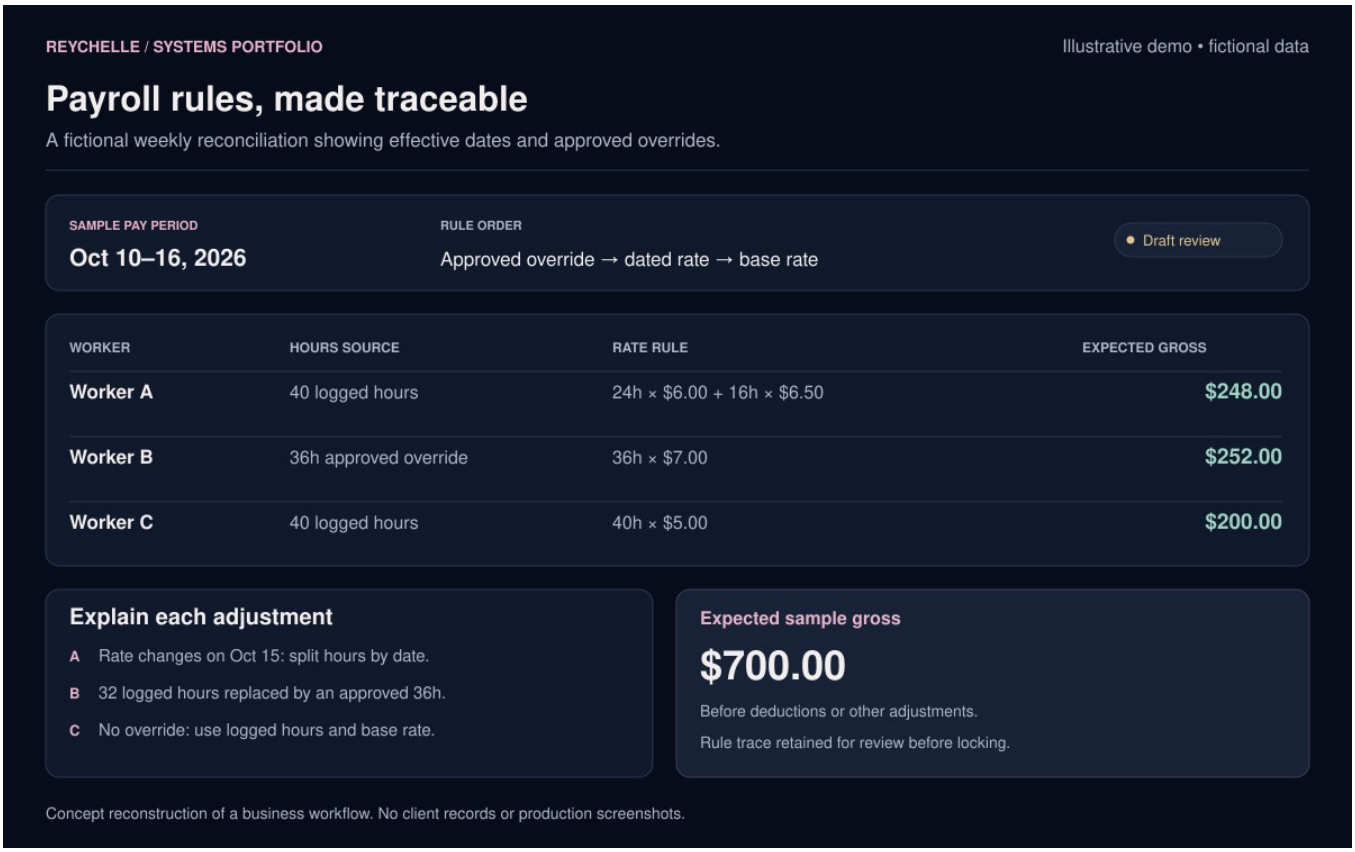

How I check the work

Follow an event through each system. Test missing fields, duplicate events, delayed responses, and failed updates before approving a change.

Numbers you can explain.

DATA / RECONCILIATION · SQL · PostgreSQL · Operational reporting

Illustrative demo · fictional data. These visuals explain representative workflows; they are not screenshots of client systems or measured outcomes.

The problem

Aliases, changing rates, manual overrides, and incomplete synchronization can make two reports disagree.

My contribution

I investigate record mapping and attribution, reconcile staged data, and maintain weekly payroll and time-tracking workflows with business-rule checks.

How I check the work

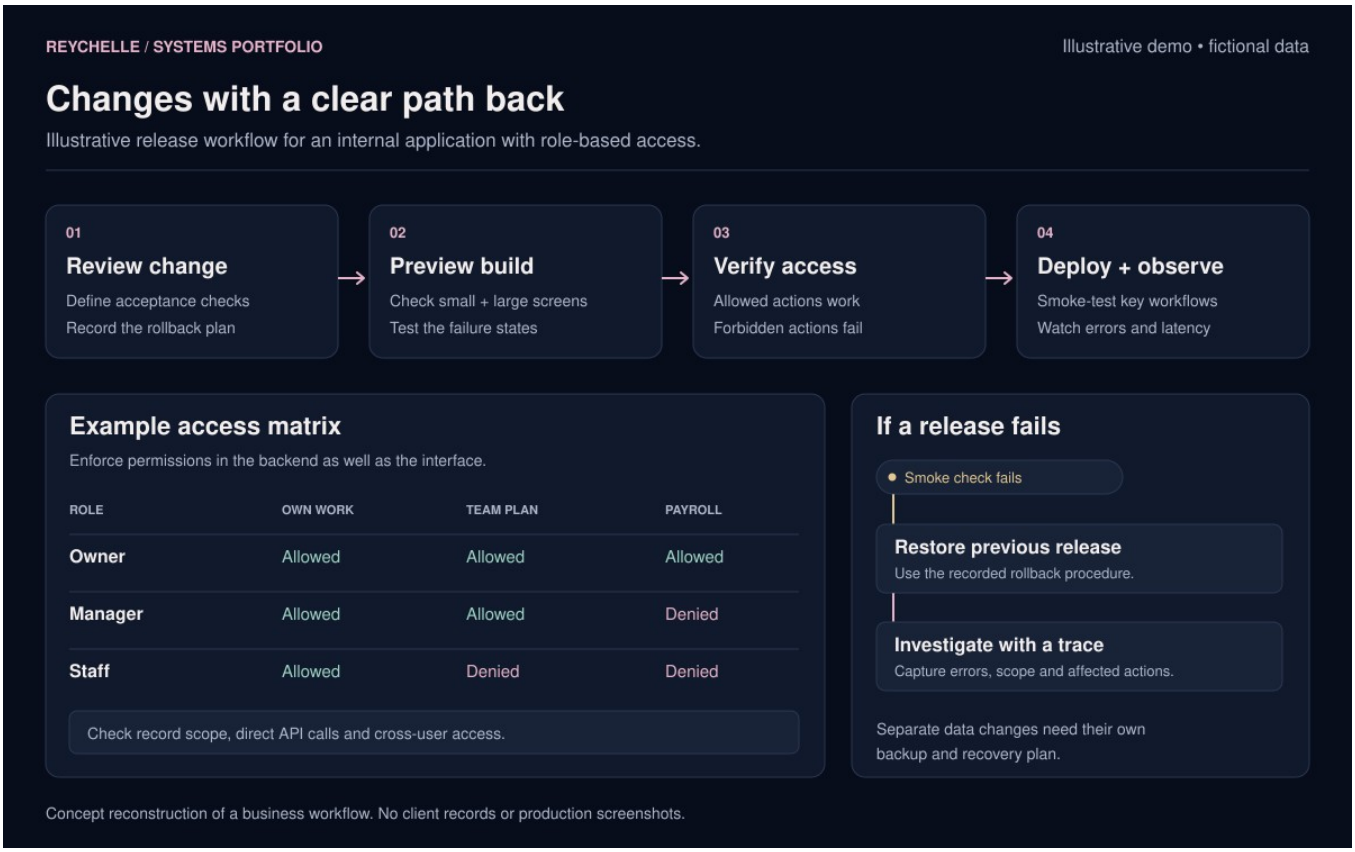

Compare source and report totals. Inspect unmatched records and duplicates, verify effective dates, and review exceptions before approval.

REYCHELLE BARROT / SELECTED WORK

From requirement to release.

WEB DEVELOPMENT / DELIVERY · HTML · CSS · JavaScript · GitHub · Coolify

Illustrative demo · fictional data. These visuals explain representative workflows; they are not screenshots of client systems or measured outcomes.

The problem

A small interface or database change can affect the way a team works. A useful release needs a clear requirement and a way to verify it.

My contribution

I use AI-assisted development to maintain websites and internal tools, coordinate changes through GitHub and Coolify, and verify user flows and data after updates.

How I check the work

Define acceptance criteria, inspect the proposed change, test the affected workflow, and document the release and recovery steps.
